

NAMOZA

Healthcare Growth & Strategy

Developer

Assignment Brief - Web Dev & Martech

Role	Developer - Position 1 (Client Web + Martech)
Time allowed	72 hours from assignment
Deliverables	3 tasks - GTM schema + landing page build + integration writeup
Presentation	30 - 45 minutes with Co-Founders
Submission	GitHub repo link + Loom walkthrough (max 8 minutes) + written answers

THE BRIEF

Developer - Position 1 Assignment

72 hours · 3 tasks · GitHub + Loom + written answers

NOTE FOR CANDIDATE

Build real, working output - not mockups or wireframes. Your submission must include a GitHub repo link with clean, commented code. Record a Loom walkthrough (max 8 minutes) explaining your decisions as you go through the repo and the live page. We will ask follow-up questions on anything you built.

THE SCENARIO

The client is OrthoNow - a chain of 9 orthopaedic clinics across Bengaluru, Hyderabad, and Chennai. They have just onboarded with Namozia for a full digital growth engagement.

Namozia is inheriting a mess: a 5-year-old WordPress site with no event tracking, GA4 configured with only pageviews, no GTM, no CRM integration, and a landing page for their 'Book a Consultation' campaign that converts at 2.1% against an industry benchmark of 6–8% for healthcare appointment pages.

You are the developer on this account. Your first month has three deliverables.

Task 01 - GTM Event Schema

Namozia needs to implement full event tracking for OrthoNow before any paid campaigns go live. Without it, the performance marketing team is flying blind.

OrthoNow's website has the following key interactions:

- Appointment booking form - 3 steps: (1) select clinic location + specialty, (2) enter name/phone/preferred date, (3) confirm booking
- 'Call Now' buttons - present on homepage, each clinic location page, and the landing page
- WhatsApp chat widget - floating button, opens wa.me link
- 'Download Patient Guide' - PDF download, gated behind name + phone form
- Clinic location page views - 9 pages, one per clinic
- Blog article reads - scroll depth matters here

Deliver the following:

- A complete GTM event schema - every event you would implement, in a structured table. For each event: Event Name, Trigger Type, Key Parameters (minimum 3 per event), and which GA4 report or audience this event feeds into.
- For the 3-step booking form specifically: define exactly how you would track funnel drop-off between steps. What GTM trigger fires at each step, what dataLayer push looks like, and how you would surface the step-level drop-off in GA4 Funnel Exploration.
- One conversion action you would import into Google Ads from this schema, and why that one over the others.

Present the schema as a table. The dataLayer push for the booking form steps should be shown as actual JSON - not pseudocode.

Example JSON format:

```
{
  'event': 'booking_step_complete',
  'step_number': 1,
  'step_name': 'location_specialty_selected',
  'clinic_location': '{{clinic name}}',
  'specialty': '{{specialty selected}}'
}
```

⚠ WHAT WE'RE ACTUALLY TESTING HERE - INTERVIEWER ONLY

AI generates event schemas fluently. The filter is the dataLayer JSON for the booking form steps - specifically whether the candidate understands that GTM cannot natively listen to multi-step form interactions without custom dataLayer pushes from the front-end developer. Ask them in the presentation: 'Who writes the dataLayer push - you or the front-end dev? Walk me through how you'd brief the dev team to implement step 2.' If they think GTM handles this automatically, they've never actually built a funnel tracking setup from scratch.

Task 02 - Landing Page Build

OrthoNow's current 'Book a Consultation' landing page converts at 2.1%. Build a replacement.

Requirements:

- Build using HTML, CSS, and vanilla JS - no frameworks. It must be a single self-contained file that runs in a browser without a server.
- The page is for the campaign: 'Get an expert orthopaedic opinion - Book your consultation at OrthoNow.' Target audience: working professionals aged 28–50 in Bengaluru experiencing knee or back pain.
- Must include: headline + subheadline, a 2-field form (Name + Phone - keep it minimal), a trust element (you decide what - reviews, doctor credentials, clinic count), a primary CTA button, and mobile responsiveness.
- The form submit should: (a) fire a GTM dataLayer push - `window.dataLayer.push({event: 'consultation_form_submitted', ...})` with at least 2 parameters, (b) show a thank-you state without page reload.
- Core Web Vitals: the page must score 90+ on PageSpeed Insights Mobile. Submit your PageSpeed screenshot.

You will be assessed on:

- Conversion architecture - does the page earn a form fill? Is the hierarchy right? Does the CTA placement make sense?
- Code quality - is it clean, commented, and maintainable? Would another developer understand it in 5 minutes?
- Mobile experience - not just 'responsive' - does it feel built for mobile, not just shrunk?
- The GTM dataLayer push - is it correct, and does it fire on submit (not on page load)?

What we are not assessing:

- Visual polish or design sophistication - clean and functional beats beautiful and slow

- Number of features - a tight 5-element page that converts beats a feature-heavy page that confuses

⚠ WHAT WE'RE ACTUALLY TESTING HERE - INTERVIEWER ONLY

AI-generated landing pages are immediately recognisable: generic hero copy ('Your Health, Our Priority'), stock-photo placeholders, and form elements that look wired up but aren't. The PageSpeed score requirement is the hard technical filter - AI cannot fake a 90+ mobile score. In the Loom, ask them to show you the form submit firing in the browser console (window.dataLayer should log the push). If they can't show it live, it doesn't work.

Task 03 - Integration Design

This is a written task - no code required.

OrthoNow wants to connect their new landing page to their CRM setup. They use HubSpot as their CRM. When a patient submits the consultation form, three things need to happen automatically:

- A new contact is created (or updated if the phone number already exists) in HubSpot with: Name, Phone, Clinic Preference (from the form), Source = 'Google Ads - Consultation Landing Page', and Lead Status = 'New Enquiry'
- A WhatsApp message is sent to the patient within 2 minutes confirming their enquiry (via Namoza's WhatsApp Business API setup on Karix)
- The Google Ads conversion 'consultation_form_submitted' fires so the campaign can optimise toward this action

Answer the following in 300–400 words:

- How would you architect this integration end-to-end? What connects to what, in what order, and what technology sits at each step? Be specific - name the actual tools/methods (HubSpot Forms API vs. native embed vs. Zapier vs. Make vs. direct API call - pick one and justify it).
- What is the single biggest failure point in this setup, and how would you build a fallback for it?
- The WhatsApp message must fire within 2 minutes. What could break this SLA and how would you monitor it?

⚠ WHAT WE'RE ACTUALLY TESTING HERE - INTERVIEWER ONLY

This question has one trap: the phone number deduplication in HubSpot. HubSpot's default deduplication is on email - not phone. A candidate who doesn't flag this has never actually integrated a form with HubSpot in a context where email isn't collected (which is common in Indian healthcare lead gen). Ask them: 'If two patients submit with the same phone number but different names, what happens in your setup?' The answer reveals whether they've thought through the data model or just described a generic CRM integration.

SUBMISSION FORMAT

- GitHub repo - public or share access with himanshu@namoza.com. Repo must contain: Task 1 (schema as markdown table + JSON snippets), Task 2 (single HTML file + PageSpeed screenshot), Task 3 (written answer as README or markdown file).
- Loom video - max 8 minutes. Walk through: your GTM schema decisions (2 min), a live demo of the landing page form firing the dataLayer push in browser console (3 min), your integration architecture answer (3 min). No slides - screen share your actual work.
- Send the repo link + Loom link to naman@namoza.com with subject: Developer Assignment - [Your Name]
